Brief Introduction:

GHRP-2 (growth hormone-releasing peptide 2) is a hexapeptide version of growth hormone secretrophins. It is a second-generation GHRP, unlike its first-generation brother GHRP-6.

The main difference between the two is that it increases the appetite encountered when using them. Unlike GHRP-6, this peptide does not cause severe starvation side effects associated with GHRP-6. However, some users experienced a slight increase in hunger.

Applicition:

For medical purposes

The second-generation GHRP was marketed in Japan by Kaken Pharma for the treatment of growth hormone deficiency (GHD). For example, pituitary dwarfism (when the body does not produce enough growth hormone) has been studied and has entered phase 2 clinical trials.

Function:

1. Promote the increase of GH in body and greatly reduce body fat.
2. Anti-aging, promote metabolism.
3. Improve sleep quality.
4. Strengthen the immune system.
5. Increase IGF-1 helps restore and affect almost all cells in the body
6. Promote the body's own secretion of HGH
