Brief Introduction:

Gonadorelin is another name for gonadotropin-releasing hormone (GnRH). Gonadorelin (also referred to as Gonadorelin Acetate) is a synthetically produced gonadotropin-releasing hormone (GnRH). Gonadorelin is another name for gonadotropin-releasing hormone (GnRH). It is a synthetic decapeptide prepared using solid phase peptide synthesis. GnRH is responsible for the release of follicle stimulating Gonadorelin hormone and leutinizing hormone from the anterior pituitary.

Application:

1. For Pharmacodynamics

Gonadorelin is responsible for the release of follicle stimulating hormone and leutinizing hormone from the anterior pituitary. In the pituitary GnRH stimulates synthesis and release of FSH and LH, a process that is controlled by the frequency and amplitude of GnRH pulses, as well as the feedback of androgens and estrogens. The pulsatility of GnRH secretion has been seen in all vertebrates, and it is necessary to ensure a correct reproductive function. Thus a single hormone, GnRH, controls a complex process of follicular growth, ovulation, and corpus luteum maintenance in the female, and spermatogenesis in the male. Its short half life requires infusion pumps for its clinical use.

2. For Animals

GNRH is available as gonadorelin hydrochloride)and gonadorelin diacetate tetrahydrate for injectable use. Studies have described it being used via an infusion pump Gonadorelin system to induce ovulation in patients with hypothalamic hypogonadism. It is also used in veterinary medicine as a treatment for cattle with cystic ovarian disease.
