Brief Introduction:

HGH is a recombinant human growth hormone produced by recombinant DNA technology. This product is a protein solution composed of 191 amino acid residues produced by recombinant technology. It can be added with appropriate extrantant or stabilizer. The amount of recombinant human growth hormone (C990H1528N262O300S7) should not be less than 0.91mg per 1mg protein.

Function:

1. Promote growth and regulate bone metabolism

Stimulate the differentiation and proliferation of epiphyseal chondrocytes, thereby promoting bone growth and increasing bone length.

It can directly stimulate osteoblast metabolism and play an important role in maintaining bone mineral content and bone mineral density.

Interacted with sex hormone and calcification hormone in bone remodeling.

2. Regulate substance metabolism

Promote protein synthesis and correct negative nitrogen balance.

Regulate lipid metabolism, reduce body fat reserves, increase serum fatty acid content, reduce serum cholesterol and low density lipoprotein levels.

It can reduce the sensitivity of cells to insulin, reduce the use of glucose by peripheral tissues, and increase blood glucose.

It plays an important role in water and mineral metabolism. Can make cell potassium salt, phosphate retention, but also promote the renal tubule sodium absorption, cause water, sodium retention.

3. Other effects

Increase body immunity, stimulate immunoglobulin synthesis, promote macrophage and lymphocyte proliferation.

Accelerate wound healing, stimulate the synthesis of collagen by fibroblasts in burn wounds and surgical incision.

Promote myocardial protein synthesis, increase myocardial contractility, reduce myocardial oxygen consumption.

GH has anti-aging effect and promotes brain function. Promote sperm formation, ovulation, etc
