Brief Introduction:

GHRP 2 is a synthetic ghrelin analogue. Like ghrelin, it stimulates release of endogenous from somatotropes in the anterior pituitary; also like ghrelin, it is synergistic with endogenous releasing-ormone (GHRH) as well as with synthetic GHRH analogues such as Sermorelin or GRF(1-29). Whereas GHRP 2 and other ghrelin analogues increase the number of somatotropes involved in the GH pulse by inhibiting somatostatin, GHRH increases the pulse amplitude per pituitary cell or somatotrope by other means. Unlike ghrelin, GHRP 2 is not lipogenic meaning it does not induce fat storage. While ghrelin has a very important role in hunger, GHRP 2 as an analog of ghrelin does not increase appetite significantly. GHRP 2 is synergistic with GHRH due to secondary actions on hypothalamic neurons. The quantity of GH released by a living mammal to which GHRP 2 and GHRH are administered exceeds the combined release of each compound when measured when taken alone.

GHRP-2 is considered to be a true secretagogue, meaning that it stimulates the body's own secretion. H.G.H has been shown in studies to promote lean body mass and reduce adiposity (fat). GHRP 2 has demonstrated that it is very effective at stimulating GH production in research test subjects.
