Brief Introduction:

MK-677 is a non-peptide oral growth hormone that stimulates GH release through receptors different from the growth hormone-releasing hormone receptors in the pituitary and hypothalamus. MK-677, as an effective oral growth hormone secretory, mimics the effects of GH in stimulating endogenous hormones. It has been shown to increase release and produce a sustained increase in plasma hormones, including growth hormone and IGF-1, but does not affect cortisol levels.

MK 677 is a very effective product, especially for the expansion cycle. This is why, after taking MK 677, I am still wondering if this product needs a post-cycle therapy or PCT. But since the product does not inhibit natural testosterone production and does not affect natural growth hormone production, this means post-cycle treatment is not necessary.

MK 677 users say they've noticed a positive change in their overall body shape in just a few days. In addition to their muscles looking fuller and more vascularized than before, the gains they can make are also more obvious.
