Brief Introduction:

RAD140 is a nonsteroidal selective androgen receptor modulator, or Sarm, that resulted from an internal drug discovery program that began in 2005.

Because of its high anabolic efficacy, receptor selectivity, potent oral activity and long duration half-life, we believe that Rad140 has clinical potential in a number of indications where the increase in lean muscle mass and/or bone density is beneficial, such as treating the weight loss due to cancer cachexia, muscle frailty and osteoporosis.

**Function:**

RAD140 improves speed, endurance and endurance during intense training. Optimize high-intensity training and interval training.

RAD140 has a stronger anabolic effect than RAD140. RAD140 produces similar results to testosterone, but without the side effects.

RAD140 reduces the side effects of testosterone and, when used in combination with anabolic steroids, effectively reduces the side effects of testosterone stimulation of the prostate and seminal vesicles.

RAD140 can help you lose weight by increasing fat loss.

RAD140 increases metabolism by increasing muscle and bone cells, making it easier to lose weight.
