Brief Introduction:

Oseltamivir Phosphate is a kind of anti-influenza drugs, under the trade name Tamiflu. Its appearance exhibits as white to yellowish-white powder. It can be divided into type A (alpha) and B (Beta) selective inhibitor of the influenza virus neuraminidase and can prevent the release of virus from infected cells, through inhibiting the activity of the influenza virus neuraminidase, thus achieving the purpose of control of influenza symptoms. Clinically it can be used for treatment of the type A influenza and type B influenza in adults and children of 1 year old or over 1 year old as well as the clinical prevention of influenza A and B in adult and adolescent of 13 year old or over 13 years old.

Oseltamivir Phosphate can subject to rapid metabolism into oseltamivir carboxylate after gastrointestinal absorption with 75% of the total oral administrated dose participating in the systemic circulation in the form of oseltamivir carboxylate.
