Brief Introduction:

Cefixime (Cefixime) is the third generation of cephalosporin antibiotics for oral use, which is suitable for the treatment of respiratory, urinary and biliary tract infections caused by sensitive bacteria. Cefixime is highly stable to β -lactamase produced by gram-negative bacilli, and its antibacterial effect on gram-negative bacilli is stronger than that of the first generation and the second generation cephalosporins, while its antibacterial effect on gram-positive cocci is inferior to that of the first generation and the second generation cephalosporins. At present, cefixime drugs approved by the State Food and Drug Administration include tablets, capsules, dispersible tablets, dry suspension and granules, all of which are prescription drugs.
