Brief Introduction:

Cibinetide is a first-in-class synthetic peptide designed to activate innate repair mechanisms in the setting of tissue injury as a result of the inflammatory cascade. It selectively binds to the Innate Repair Receptor (IRR) which activates tissue protective, reparative, and anti-inflammatory signaling pathways.

Cibinetide lacks erythropoietic effects as it does not activate EPOR homodimers. Correspondingly, unchanged Hb levels have been reported following repeated applications of cibinetide in patients. Thus, cibinetide is not associated with unintended side effects such as thromboembolism secondary to stimulation of erythropoiesis as ascribed for full length recombinant erythropoietin.
