Function:

Palmitoyl Oligopeptide sequence is found in proteins of the extracellular matrix such as the α chain of collagen, and it is believed to be released during wounding and inflammation. A feedback stimulation of collagen repair has also been proposed

for this peptide, but the main benefit to photoaged skin is believed to be the enhanced delivery of copper. It is found to have the beneficial effects on collagen stimulation.

1. Firms the skin and aids in collagen production

As we age, collagen in the skin breaks down into peptides, which send signals to skin cells, informing them to make more collagen to replace what was lost. Topical application of peptides increases this signalling, thereby increasing new collagen production.

2. Reduces the appearance of fine lines

By stimulating collagen production, peptides help to make the skin appear more plump and youthful.
