#### Brief Introduction:

This is a brand new peptide found in Belgian blue cattle. This grass-market animal is able to grow pure muscle like crazy in its natural state because it has this substance in its body. Ingesting this peptide, the muscles are freed from myostatin for a short time. The FST344 features:

1. Muscle mass is at least twice that of peers;
- 2 Very low fat;
3. There will be no problems with visceral hypertrophy.

Because FST344 is a hormone that only targets skeletal muscle, it binds and binds Myostatin to Myostatin, which does not allow it to play its role. Without inhibition, muscles will grow freely and frantically.

#### Function:

##### 1 Muscle Growth

FST has gained attention in the bodybuilding community due to claims that it can significantly boost muscle mass, although there are relatively few scientific studies that directly back this up in healthy human subjects.

##### 2 Preventing Muscle Loss

Boosting FST levels has also been tested as a treatment for sarcopenia, an age-related muscle-wasting disease. In old mice, daily injections of epicatechin (a natural compound that increases FST levels) led to increased overall muscle strength. The same treatment in 6 human subjects increased their hand grip strength after seven days

##### 3 Baldness

A small trial on 26 men with male-pattern Baldness found that a single injection of FST with other growth factors increased the number of hairs on the head as well as their thickness (follicle density and hair shaft thickness). These beneficial effects lasted for up to a year with only a single treatment without needing repeated administrations
