Brief Introduction:

Adipotide, a peptidomimetic with sequence CKGGRAKDC-GG-D(KLAKLAK)₂, is an experimental proapoptotic drug that has been shown to cause rapid weight loss in mice and rhesus monkeys. Its mechanism of action is to target specific blood vessels supplying adipose tissue with blood, cause the vessels to shrink and the fat cells fed by those vessels to undergo apoptosis. Adipotide is designed to bind to two receptors, ANXA2 and prohibitin, that are specific to blood vessels supplying white adipose tissue.

Function:

Adipotide is an experimental treatment that prevents the blood supply to fat cells. This has helped obese monkeys to lose on average 11% of their body weight in four weeks, perhaps opening the way for therapy in humans, according to a recent research study. The study, published in the journal *Science Translational Medicine*, shows that body mass index and waist circumference of the rhesus monkeys were reduced.
