Brief Introduction:

This fragment is a modified form of amino acids 176-191 at the c-terminal region of the hgh. Studies have shown that it works by mimicking the way of natural hgh regulates fat metabolism but without the adverse effects on insulin sensitivity (blood sugar) or cell proliferation (muscle growth) that seen with unmodified. This HG fragment 176-191 stimulates lipolysis (breaking down of fat) and inhibits lipogenesis (the formation of fatty acids and other lipids in the body).

There is no question why modern bodybuilders utilize this product, its ability to regulate fat loss, pack on size and increase clenbuterol). Multiple studies have shown that frag 176-191 will not cause hyperglycemia. In addition, it will promote lean body mass,protein synthesis, increase bone mineral density, and better sleep.

Application

The GH fragment 176-191 stimulates lipolysis and inhibits lipogenesis both en vivo/en vitro.

Fragment 176191 has shown no effect on growth or insulin resistance, unlike the full GH molecule. This is the newest, most powerful GH fragment on the market. Studies have shown sustained fatloss, aimed directly at adipose tissue.

It has been shown that the fat-reducing effects of GH appear to be controlled by a small analog region of the C-terminus end of the GH molecule. This region consists of amino acids 176-191, thus the name. This peptide fragment works by mimicking the way natural hGH regulates fat metabolism but without the adverse effects on blood sugar that is seen with unmodified HGH.

Function:

1. Promotes growth,regulates bone metabolism
2. Regulates substance metabolism
3. Promotes tissue growth
4. Promotes protein synthesis
5. Good for fat-burning
6. Reduces the use of glucose
7. Promotion water and mineral metabolism
8. Anti-aging, brain functional promotion, increasing myocardial and immune functions.
