#### Brief Introduction:

This fragment is a modified form of amino acids 176-191 at the c-terminal region of the hgh. Studies have shown that it works by mimicking the way of natural hgh regulates fat metabolism but without the adverse effects on insulin sensitivity (blood sugar) or cell proliferation (muscle growth) that seen with unmodified. This HG fragment 176-191 stimulates lipolysis (breaking down of fat) and inhibits lipogenesis (the formation of fatty acids and other lipids in the body).

There is no question why modern bodybuilders utilize this product, its ability to regulate fat loss, pack on size and increase clenbuterol). Multiple studies have shown that frag 176-191 will not cause hyperglycemia. In addition, it will promote lean body mass,protein synthesis, increase bone mineral density, and better sleep.
