Brief Introduction:

Magnesium is one of the greatest deficiencies in the modern western world, which is particularly troubling given the mineral's involvement in over 300 enzymatic actions in the body. Magnesium (2R,3S)-2,3,4-trihydroxybutanoate powder is one of the most bioavailable forms of magnesium and specifically for improving magnesium levels in the brain.

Developed by a Chinese scientist at UCLA, Magnesium (2R,3S)-2,3,4-trihydroxybutanoate is a combination of the mineral magnesium with a chelating agent called L-threonate. The latter is helpful for crossing the blood-brain barrier and bioavailability.

These effects combine to provide long and short term memory enhancements, neuroprotective effects combating cognitive decline, can improve sleep quality and reduce symptoms of anxiety and depression.
