Brief Introduction:

OEA, Oleoyl ethanolamide or oleoylethanolamide, is a naturally occurring lipid that binds with high affinity to the PPAR- α , that may have effects on preventing and curing atherosclerosis. Report shows OEA can turn off the switch in the central nervous system for hunger, it is conducive to modulate food intake and weight management. Moreover, OEA also can be used for Beneficial effect on analgesic and Anti- depression.

Application and Function:

Oleoylethanolamin (OEA) is an endogenous peroxisome proliferator-activated receptor alpha (PPAR- α) agonist. OEA is a naturally occurring ethanolamide lipid that regulates feeding and body weight in vertebrates ranging from mice to pythons. OEA is the monounsaturated analogue of the anandamide, but unlike anandamide it acts independently of the pathway, regulating PPAR- α activity to stimulate lipolysis. OEA is produced by the small intestine following feeding in two steps.

Oleoylethanolamide(OEA) is a molecule produced in the body, usually found in the intestines. It is responsible for the feeling of satiety following meals. Some evidence suggests that OEA may be able to aid fat loss by acting on PPAR. When this receptor is activated in fat tissue, energy expenditure increases. So we can loss weight byoral supplementation of OEA.
