Brief Introduction:

Noopept (GVS-111) is a medication promoted and prescribed in Russia and neighbouring countries as a nootropic. IC₅₀ Value: Target: in vitro: Nooglutit exhibits pharmacologically significant competition with a selective agonist of AMPA receptors ([G-3H]Ro 48-8587) for the receptor binding sites (with IC₅₀ = 6.4 +/- 0.2 microM), while the competition of noopept for these receptor binding sites was lower by an order of magnitude. GVS-111 significantly increased neuronal survival after H₂O₂-treatment displaying a dose-dependent neuroprotective activity from 10 nM to 100 microM, and an IC₅₀ value of 1.21 +/- 0.07 microM. GVS-111 inhibited the accumulation of intracellular free radicals and lipid peroxidation damage in neurons treated with H₂O₂ or FeSO₄, suggesting an antioxidant mechanism of action
