Brief Introduction:

PRL-8-53 is an experimental compound which many believe to be one of the most effective memory boosters available. Its full name is methyl 3-(2-(benzyl(methyl)amino)ethyl)benzoate.

Researchers found that oral supplementation of PRL-8-53 was able to improve avoidance learning in rats. One human study has also been done on PRL-8-53. Each participant ingested a placebo and PRL-8-53, at separate times, in a double blind crossover study. Participants then took a memory test, consisting of twelve monosyllabic words in a particular order. The test was conducted three times, immediately after supplementation, one day after supplementation, and four days after supplementation.

Although the evidence is scarce, there are signs this synthetic nootropic compound may be able to improve learning ability and memory formation.
