Discription:

Man is the anterior pituitary GH, GH containing eosinophilic granular secretory cells secrete, consisting of 191 amino acid peptide hormone. This product is in escherichia coli (e.c. with our fabrication: oli) in the composite.

The major role of GH is to stimulate the liver to secrete Insulin-like Growth Factor-I (IGF-I). IGF-I stimulates production of cartilage cells, resulting in bone growth and also plays a key role in muscle protein synthesis and organ growth.

It works to return growth hormone levels to those of a non-growth-hormone-deficient individual. In children, GH can increase growth rate and promote the development of muscle. In adults, it can build muscle, increase energy, and reduce body fat. Stimulate the synthesis of immunoglobulin, lymphoid tissue, macrophages and lymphocyte proliferation, enhance ability to resist infection.
