Discription of gh peptides frag gh

GH Fragment 176-191 is a spliced variant of native gh. Specifically, it is made of the last 16 amino acids on GH's long 191 amino acid sequence. it works by mimicking the way natural GH regulates fat metabolism but without the adverse effects on insulin sensitivity (blood sugar) or cell proliferation (muscle growth) that is seen with unmodified GH. Like unmodified GH, the GH fragment 176-191 stimulates lipolysis (breaking down of fat) and inhibits lipogenesis (the formation of fatty acids and other lipids in the body).

Function of gh peptides frag gh

To date, studies suggest that GH Fragment 176 191 has several beneficial features: it reduces abdominal fat, without compromising glycemic control (blood glucose), it increases muscle mass and improves the lipid profile. GH Fragment is a local area fat reducer and inhibits the formation of lipids, GH Fragment is estimated to be over 10 times stronger than regular growth hormone in fat reduction.
