Brief Introduction of medicine peptide gh fragment raw powder

Peptide gh fragment has been shown to contribute to lipolysis a process that aids in the breakdown and elimination of fat from the body. Growth hormones are produced by the pituitary. The process of making Peptide gh fragment 176-191 occurs in the laboratory, where a synthetic version of the Growth Hormone is produced. This is to elevate the levels of GH fragments, which have long been associated with the process of losing fat in the body.

Growth Hormone peptide gh fragment 176-191, also known as GH Frag 176-191, is a modified form of amino acids 176-191 of the GH polypeptide.

The (gH fragment 176-191) exhibits the ability to burn through stubborn adipose tissue, while increasing energy expenditure, muscle mass, and fat oxidation. All studies have pointed to the fact that the fragment is an effective treatment for obesity and fat loss, and much safer than its GH counterpart.

Function of medicine peptide gh fragment raw powder

1. Increase in muscle mass
2. Enhances the lipid content of the body.

Usage of medicine peptide gh fragment raw powder

The peptide gh fragment 176-191 stimulates lipolysis and inhibits lipogenesis both en vivo/en vitro.

Peptide gh fragment has shown no effect on growth or resistance, unlike the full GH molecule. This is the newest, most powerful GH fragment on the market. Studies have shown sustained fatloss, aimed directly at adipose tissue.

It has been shown that the fat-reducing effects of GH appear to be controlled by a small analog region of the C-terminus end of the GH molecule. This region consists of amino acids 176/191, thus the name. This peptide fragment works by mimicking the way natural GH regulates fat metabolism but without the adverse effects on blood sugar that is seen with unmodified GH.
