Brief Introduction of injectable raw powder peptides frag 176

Growth hormone peptide fragment 176-191, or HGH Frag 176-191, is made from amino acids 177–191 of human growth hormone with an additional tyrosine amino acid.

HGH Fragment 176-191 has been shown to contribute to lipolysis a process that aids in the breakdown and elimination of fat from the body. Growth hormones are produced by the pituitary. The process of making HGH Frag 176-191 occurs in the laboratory, where a synthetic version of the Growth Hormone is produced. This is to elevate the levels of GH fragments, which have long been associated with the process of losing fat in the body.

The (hgh fragment 176-191) exhibits the ability to burn through stubborn adipose tissue, while increasing energy expenditure, muscle mass, and fat oxidation. All studies have pointed to the fact that the fragment is an effective treatment for obesity and fat loss, and much safer than its Human Growth Hormone counterpart.

Function of injectable raw powder peptides frag 176

- 1.Rapid burning of body fat tissue
- 2.Slowing down the aging processes of the whole organism
- 3.Strengthening of bone tissue
- 4.Increasing the amount of produced energy due to the natural lipolysis

Usage of injectable raw powder peptides frag 176

The GH fragment 176-191 stimulates lipolysis and inhibits lipogenesis both en vivo/en vitro.

Fragment 176/191 has shown no effect on growth or resistance, unlike the full GH molecule. This is the newest, most powerful GH fragment on the market. Studies have shown sustained fatloss, aimed directly at adipose tissue.

It has been shown that the fat-reducing effects of GH appear to be controlled by a small analog region of the C-terminus end of the GH molecule. This region consists of amino acids 176/191, thus the name. This peptide fragment works by mimicking the way natural hGH regulates fat metabolism but without the adverse effects on blood sugar that is seen with unmodified HGH.
