Brief Introduction of gh Frag 176-191 For Sale

Fragment (176/191) is a fat loss peptide derived from the GH molecule, which directly initiates lipolysis and inhibits lipogenesis, but in order to better understand this peptide, it is imperative to have at least a rudimentary understanding of its parent hormone.

GH fragment 176-191 is a fragment molecule of gh, which consists of 16 amino acid growth hormones (amino acids at positions 176-191 at the C-terminus of the gh). This peptide fragment stimulates lipolysis and suppresses the formation of new fat mass.

The portion of the molecule responsible for these effects is amino acids 176/191. In every sense, Frag should primarily be considered a fat loss peptide which performs these functions through the same pathways as traditional GH, but without exposing the user to the potentially undesirable side effects which may present themselves during GH administration.

There is no question why modern bodybuilders utilize this product, its ability to regulate fat loss, pack on size and increase clenbuterol). Multiple studies have shown that frag 176-191 will not cause hyperglycemia. In addition, it will promote lean body mass, protein synthesis, increase bone mineral density, and better sleep.
