What is Hgh Frag176-191

HGH Fragment 176-191 is also known as HGH Frag 176-191 or simply HGH Frag.

HGH fragment 176-191 is also known as Growth Hormone Peptide frag 176-191. It is a form of modified amino acids containing 16 growth hormones starting from numbers 176-191. Research has shown that this group of growth hormones greatly contributes to fat loss in the body.

HGH FRAG 176-191 is known as the most powerful peptide for weight loss. It's a fragment of human growth hormone and helps burn fat mass. HGH Fragment 176-191 can regulate fat metabolism without causing insulin problems or other undesirable side effects. Scientists discovered that HGH FRAG 176-191 stimulates lipolysis much better than HGH. Lipolysis is the decomposition of fat mass, so they concluded that HGH FRAG 176-191 inhibits lipogenesis. That is, it helps stop the formation of fatty acids and other lipids. However unlike other peptides or fat burning approaches, individuals who use HGH FRAG 176-191 have rarely or never shown hunger or nervousness caused by ephedrine. Also, HGH FRAG 176-191 does not compete with HGH receptors which means that it does not cause hypoglycemia.

Scientific Evidence of Hgh Frag176-191

Scientists conducted a lot of studies of HGH Frag in animal trials. Experiments on obese mice and rabbits with the oral drug have shown 50% of weight loss during 19 days of taking HGH Frag. Large doses of AOD 9604 (500mcg/kg) significantly increased lipolysis in fat tissue without causing side effects on insulin sensitivity.

As the fragment boosts only fat-burning processes, it has no HGH benefits such as cell proliferation or IGF-1 boost which means Frag 176-191 can not boost muscle growth or influence its preservation.

HGH Frag clinical trials in humans only start to kick into high gear, so the only witnesses of its effectiveness are real people who have already tried that supplement and experienced amazing results by themselves. Some researches revealed data from one randomized clinical trial in which the obese participants were given oral capsules with Frag 176-191 for 12 weeks every day. The results have shown an average weight reduction of 2.6 kg for clinical trial participants.

Based on provided reports, it can be seen that HGH Fragment 176-191 may burn adipose tissue in small proportions within three months. Still, the Fragment studies are controversial, and reports that suggest otherwise should also be considered. One large study in 536 individuals didn't observe perceptible weight loss results during 24 weeks of daily HGH Frag administration. However, this can be influenced by the so-called 'human factor' when people just don't keep to the recommended regimen.
