Product introduction of IGF1 Lr3

IGF1-LR3 is a breakthrough peptide that has shown great results without many of the side effects or risks of other more commonly prescribed fat loss medications. IGF-1 LR3 inhibits the movement of glucose into the body's cells which facilitates fat burning and the use of fat in the body for the production of energy. Its effects last most of the day and have made it a preferred variant by a majority of patients and physicians. When IGF-1 LR3 is active in the body, it functions differently in different types of tissues. For instance, in muscle tissue, it makes the muscle more sensitive to insulin's effects, such as a reduction in fat storage.

IGF-1 Long R3, or IGF-1 LR3, is a form of IGF that has been chemically altered with changed amino acids. It consists of 83 amino acids with a substitution of Arg(R) for the Glu(E) at position three, hence, the name R3. The alterations enable it to avoid binding to proteins in the body, which allows it to have a longer half-life.

IGF-1 LR3 is more potent than the regular IGF-1 because of the decreased binding of Long R3 IGF-1 to IGF binding proteins. Its main purpose is to increase the biological activity of IGF.
