Shelf Life	2 Years

What is PEG MGF For Bodybuilding

Polyethylene Glycol (PEG) Mechano Growth Factor (MGF) is an isoform of Insulin Like Growth Factor 1 (IGF-1) comprised of 24 amino acid residues that is stabilized by a biocompatible polymer coating (PEG). The C-terminal residue sequence of MGF infers the characteristics that make this peptide unique from IGF-11.

A natural form of MGF is expressed in muscle tissues in response to the overburdening or damage of these cells². MGF has been found to induce the stimulation of repair, regrowth, and the formation of new cells in response to stress³. This process is called hypertrophy (or hyperplasia) and is crucial in the gaining of muscle mass.

The natural production of MGF stimulates the recruitment of undamaged cells to give rise to new muscle tissues, while a liver-derived variant of this agent (IGF-1Ea) initiates the upregulation – or positive feedback control – of protein synthesis⁴. Through these biochemical pathways, MGF is thought to be the primary mechanism by which the body naturally produces new muscle tissue.

Animal studies have shown MGF as an active neuroprotective agent⁵ and a promoter of conserved skeletal health⁶. Also, reinforcing its functionality as an agent of muscle tissue repair, MGF has been found to be active in coordinating the repair of heart muscle tissue following myocardial infarction (heart attack)
