Brief Introduction of Ipamorelin

Ipamorelin is one of the latest and greatest peptides in the growth factor family. Deemed one of the safest GHRPs, Ipamorelin is a selective growth hormone (GH) Secretagogue and Ghrelin receptor agonist.

This peptide generates similar increases in growth hormone secretion, but without the appetite stimulation and increase in cortisol, acetylcholine, prolactin, and aldosterone seen with other peptides in its class.

Ipamorelin is a fascinating new muscle building discovery that is getting a lot of attention in the bodybuilding world. It is a synthetic peptide that has powerful Growth Hormone releasing properties. And these GH releasing properties are what is of interest to athletes and bodybuilders since they can make a tremendous difference in the amount of muscle you can grow and how quickly you burn fat.

Another advantage to Ipamorelin is that it doesn't cause sudden spikes in prolactin or cortisol as does GHRP-2 and GHRP-6. Ipamorelin is slower in its delivery unlike GHRP's which spike GH levels at a more rapid rate. The slower release is more natural and has a more sustained effect.
