#### What Is Melanotan-1 10mg?

Melanotan I (MT 1) is a synthetic peptide, the variant of peptide hormone, called alpha-melanocyte stimulating hormone or MSH which is produced naturally in the body and is responsible for the stimulation of melanogenesis process skin pigmentation. Alpha-MSH activates certain melanocortin receptors in the delivery of its consequences. Indeed, the MSH also has a powerful influence on lipid metabolism, appetite and sexual libido. As a result Melanotan-1 directly affects the skin tan. While Melanotan 2 and PT 141 have been studied as a potential agent for the treatment of sexual dysfunction, Melanotan-1 has been extensively studied for use in protection against the harmful effects of ultraviolet radiation of the sunlight due to its melanogenesis-stimulating properties.

Both Melanotan-1 and Melanotan-2 are analogs of peptide hormone alpha-melanocyte stimulating hormone ( $\alpha$ -MSH), which tend to cause tanning of the skin. Melanotan-1 is not a selective agonist of melanocortin receptors (MC1R, MS3-5R). As the  $\alpha$ -MSH analogue its mechanism of action is a biomimicry of the natural process of skin tanning.
