#### Brief Introduction of Epitalon 10mg

Epitalon is considered the "fountain of youth" peptide. It is a tetra-peptide, which means that it is composed of four amino acid chains. The peptide is used to regulate the cell cycle during telomerase activity. Telomerase, also called telomere terminal transferase, is an enzyme made of protein and RNA subunits that elongates chromosomes. When telomerase activity is not present (when we age), our cells age. Our telomeres get shorter and begin to die off. If telomerase is activated in our cells, our telomeres lengthen, the cell continues to grow and divide, delaying the aging process. (UT Southwestern Medical Lab)

Epitalon was discovered by the Russian scientist Professor Vladimir Khavinson. He researched this peptide of over 35 years in both animal and human clinical trials. The results were astounding. For the first time ever, human clinical trials proved beyond doubt that the substance consisted of powerful life extension and anti-aging possibilities.
