What Is AOD 9604

peptide fragment (Fragment 177-191) of the C-terminus of Human Growth Hormone to which a tyrosine is added at the N-terminal end. Studies have suggested that AOD9604 is more effective than its predecessor AOD9401 in its ability to stimulate lipolytic (fat burning) and anti-lipogenic activity. Like Growth Hormone, AOD9604 stimulates lipolysis (the breakdown or destruction of fat) and inhibits lipogenesis (prevents the transformation of fatty food materials into body fat) both in laboratory testing and in animals and humans. Recent clinical research studies have shown that AOD9604 did show a reduction of body fat in the mid abdominal area in both obese, over-weight, and average built people.

These segments of the synthetic peptide AOD9604 have been researched for their in vivo effects in laboratory mice musculus. Results have shown that AOD9604 have resulted to a short-period increase in blood glucose and a more sustained increase in plasma insulin, together with other fragments such as 172-191, 177-191 and 178-191. In addition, the researchers have suggested that functionality of the peptide depends not only in the informational sequence but should also have the correct physical configuration (Ng and Borstein 1978). Also, AOD9604, being a region of high accessibility to proteases and also rich in proline, have been demonstrated to affect the conformational change in the cytoplasmic domain of the band 3 of erythrocyte membrane protein by serving as the hinge for the pivoting of the two subdomains. This then suggest that such residue is significant in conformational changes be serving as sites for peripheral protein binding in some body cells.
