Description Of Testosterone Decanoate

Testosterone decanoate, a.k.a. Neotest 250, is probably best known as one of the ingredients in Sustanon. Neotest 250 is testosterone with the decanoate ester, a slow-acting long ester, similar to testosterone enanthate.

Testosterone decanoate commonly used in intramuscular injection solution, the oil absorption is slow, function is strong and durable, can maintain time for just a few days. More specifically, Neotests decanoate ester releases for approximately three weeks after the injection, making it similar to but slightly slower than both the cypionate and enanthate esters. At present, the decanoate version of testosterone can only be found within sustanon 250.

Testosterone Decanoate is the most commonly associated brand name to the Testosterone Decanoate product. This is an injectable testosterone hormone attached to the large/long Decanoate ester. The ester itself does not affect the compounds functions and traits; no ester has this ability. However, the attached Decanoate ester does affect the testosterone hormone's release time. This will be a very slow acting testosterone, and it will provide a slow, steady release of the hormone after a single injection.

Nandrolone decanoate 200mg /ml Stack:

Nandrolone decanoate 200mg /ml works very well for muscle buildup when combined with Dianabol (D-bol) and Testoviron Depot. The famous Dianabol (D-bol)/Nandrolone decanoate 200mg /ml stack results in a fast and strong gain in muscle mass. Most athletes usually take 15 - 40 mg Dianabol (D-bol)/day and 200-400 mg Nandrolone decanoate 200mg /ml per week. Even faster results can be achieved with 400 mg Nandrolone decanoate 200mg /ml per week and 500 mg Sustanon per week. Athletes report an enormous gain in strength and muscle mass when taking 400 mg Nandrolone decanoate 200mg /ml per week, 500 mg Sustanon per week, and 30 mg Dianabol per day. Nandrolone decanoate 200mg /ml is a good basic steroid which, for muscle buildup, can be combined with many other steroids. Although it is not an optimal steroid when preparing for a competition, many athletes also achieve good results during this phase. Since Nandrolone decanoate 200mg /ml is

a long-term anabolic, there is risk that with a higher dosage, the competing athlete will retain too much water. A conversion into estrogen, that means an aromatizing process, is possible with deca durabolin but usually occurs only at a dose of 400 mg per week.
