What is oxytocin?

Oxytocin is also called Pitocin, is a kind of uterine contraction medicine, can be extracted from animal posterior pituitary or chemical synthesis, chemical synthesis including on vasopressin, no booster effect, selective excitate uterine smooth muscle, strengthen its contracting, uterus is most sensitive to oxytocin (estrogen secretion increase) when parturient, immature uterus have no reactivity to this product, pregnancy early or middle uterine have low reactivity to oxytocin, late pregnancy is gradually increased, and before the antepartum, the reactivity is the highest. Small dose can strengthen the smooth muscle contraction rhythm at the bottom of the uterine, to reinforce the contraction force, contraction frequency, shrinkage properties similar to those in natural birth, and keep the polarity and symmetry, so the clinical used in hastening parturition, inducing abortion.

Large dose make uterine muscle tetanic contraction, clinical to oppression blood vessels between muscle fibers, to prevent and treatment of postpartum hemorrhage and postpartum subinvolution, and has the effect to promote lactation, the breast duct contraction, prompting milk from the breast, but cannot increase milk secretion, only can promote the milk. It is important to strictly master the dose and dripping speed for hastening parturition or inducing abortion, lest cause tetanic uterine contractions, killing fetal distress or uterine rupture. Every cephalopelvic disproportion, malposition or other abnormality, it is forbidden, abnormal uterine contraction, has a history of cesarean section and 3 or more times a multipara is forbidden.
