What Is Epitalon

Epitalon is a protein peptide that can stimulate the body's own natural production of telomerase within our it's cells.By doing this, it strengthens telomeres for reproduction. Your body makes telomerase, but it needs to be stimulated with the right precursors.Over time it should lengthen the telomeres of cells and refresh your entire body.

According to scientific studies based on animal test subjects, Epithalon (also known as Epitalon) has been shown to function with telomeres, which are areas of repeating DNA sequences that function to prevent gene degradation near the end of chromosomes.

Over time, telomeres become too small and weak to contain the sequence because of cell division, and the DNA becomes disrupted, which signals the start of the aging process.Epithalon works to replenish the enzyme that allows telomeres to remain more stabilized and better equipped to hold DNA in place.
