Description Of 17 - Methyltestosterone:

Methyltestosterone is a steroid hormone derived from androgens and present in mammals and other vertebrates, methyltestosterone is mainly secreted in the ovaries and mail in females, although a small amount is also secreted by the adrenal glands, methyltestosterone is the main sex hormone and anabolic steroid in males.

Methyl testosterone in the testicles and the prostate gland and other plays a key role in the development of male reproductive tissues. In addition, methyltestosterone is essential for health and well-being and for the prevention of osteoporosis. Methyltestosterone is conserved in most vertebrates, although fish differ slightly from 11-keto testosterone.

The effect of methyltestosterone is simply to increase the amount of circulating androgens through exogenous use of this hormone. This may be to combat a disease brought on by low levels, or it may be to increase androgen levels above baseline to help combat another disease.
