- GHRP2 158861-67-7 White Lyophilized Powder C46H56N12O6 817.9 2 Years, When Proper Storage 5 Box

Our Product Introduction

Product Description

Muscle Gain and Anti Aging Growth Hormone Releasing GHRP 2 CAS 158861-67-7

Product Details Of GHRP 2 :

Product Name	GHRP 2	
Appearance	White powder	
Specification	10mg/vial, 10vials/Box	
Assay	99.4%	
CAS	158861-67-7	
MF	C46H56N12O6	
Storage	2~8 centigrade	

What Is GHRP 2

GHRP-2 (Growth Hormone Releasing Peptide 2) is a growth hormone secretagogue of the hexapeptide class. Sharing many similarities with GHRP-6, GHRP-2 is the first in this class of hormones, and in many circles, is considered the better choice between it and GHRP-6.

It is not a hormone that is often used alone but is almost always used with a Growth Hormone Releasing Hormone (GHRH) such as PEG-MGF. The compound may also be commonly found under the names Pralmorelin or GHRP Kaken 100.

However, in most pharmaceutical and performance based circles, it has in recent years been most commonly referred to as GHRP-2.

GHRP-2 will come in dry powder (Lyophilized) form and will be reconstituted with bacteriostatic water. It may be found as an individual item or as part of an overall GHRH mixture.

Some pharmacies provide GHRH compounds with added GHRP-2 or GHRP-6. The compound may be injected subcutaneously or intramuscularly depending on individual preference. Once reconstituted, GHRP-2 must be kept refrigerated.

GHRP-2 can be used indefinitely and will normally be used continuously in anti-aging plans that call for it with a GHRH. Dosing can range dramatically depending on need with 100-300mcg per day being commonplace. If used with a GHRH, which is recommended, the dose may often be towards the lower end of the scale.

For optimal results, the user will find two injections per day on an empty stomach to be best. If done subcutaneously this should prove to be the easiest method as it will be the least intrusive.

The major differences between the 3 GHRP peptides lays in their side effects. GHRP-6 causes a significant increase in hunger for many, therefore making it good for people looking to "bulk" but no so good for those trying to lose fat.

GHRP-2 is often preferred for people dieting as it does not stimulate hunger, however it does raise cortisol (a stress hormone), prolactin (a hormone which can diminish sex drive) and aldosterone (a hormone which promotes water retention) more than GHRP-6 and Ipamorelin. Ipamorelin is similar to GHRP-6 in that it causes an increase in hunger (but it's not as dramatic as GHRP-6). However, since it does not raise cortisol, prolactin or aldosterone at recommended dosages it is a preferred choice for those who are sensitive to these hormones.

Benefits Of GHRP 2

- 1.Decreases in body fat
- 2. An increase in lean mass
- 3. Increased collagen production
- 4. Improved sleep
- 5. Increased cellular repair
- 6. An increase in IGF-17.Increases in bone density
